TOSOH BIOSCIENCE

ABOUT US

WITH A GLOBAL PERSPECTIVE.

TOSOH BIOSCIENCE GmbH, Separations Business Unit, Stuttgart, is an acknowledged global leader in the field of bioseparations. Established as TosoHaas in 1987, the original joint venture between Tosoh Corporation of Japan and the Rohm and Haas Company, USA, has become synonymous with advanced products and quality support. In the year 2000, Tosoh Corporation acquired a 100% controlling interest changing the name to TOSOH BIOSEP. In the course of unifying all Tosoh affiliates, the new Brand Name Tosoh Bioscience evolved. Today, the two branches, Bioseparations and Diagnostics operate with the same name Tosoh Bioscience - Separations Business Unit and accordingly Diagnostics Business Unit. Tosoh manufacturing sites in Japan provide products to the sales and support subsidiaries in the U.S. and Europe, ensuring full global coverage. Over the last 30 years, TSKgel SW columns have become the worldwide industry standard for size exclusion chromatography of biomolecules.

INTRODUCTION

OUR HISTORY

Tosoh Bioscience is an acknowledged leader in the field of bioseparations. Established in August 1987 as TosoHaas, we were the joint venture of two multi-billion dollar companies: Tosoh Corporation of Japan and Rohm and Haas Company, USA. In the year 2000, Tosoh Corporation purchased Rohm and Haas Company's business interest in TosoHaas and formed Tosoh Biosep subsidiaries with sales, marketing, and technical service offices in the U.S. and Germany. In 2002, Tosoh Biosep was re-organized with Tosoh's clinical diagnostic business units under the name of Tosoh Bioscience. In 2007, Tosoh Scientific Instrument Division changed its name to Tosoh Bioscience Division and Tosoh (Shanghai) Co., Ltd. was also created.

A GLOBAL PERSPECTIVE

Since our beginnings, we have become an effective manufacturing partner with many of the world's most innovative pharmaceutical and biotechnology companies. Our TSKgel® and Toyopearl® chromatographic resins are important components in the analysis, isolation, and purification of biomolecules. Tosoh's portfolio of over 500 specialty items encompassing all common modes of liquid chromatography can help purify any protein, peptide, enzyme, nucleic acid, antibiotic, or small molecule that may be encountered.

SEAMLESS SCALE-UP WITH POLYMER RESINS

The polymeric TSKgel PW-type analytical HPLC columns and Toyopearl production scale resins are made using the same chemistry. This gives them the same chromatographic selectivity so that an analytical method developed on a TSKgel column can be easily scaled to the corresponding bulk Toyopearl resin for manufacturing use. This product synergy saves valuable development time.

TOSOH'S TECHNOLOGY

For over thirty-five years our parent, Tosoh Corporation, has been a world leader in the analysis and purification of proteins. Tosoh's TSKgel SW columns are the industry standard for size exclusion chromatography of biomolecules. This has led Tosoh to a fundamental understanding of the role played by pore diameter and molecular size in chromatographic separations. This knowledge allows Tosoh to design higher performance polymeric resins for ion exchange, hydrophobic interaction, affinity and reversed phase applications.

NEW PRODUCT CREATION

Tosoh Bioscience and Tosoh provide solutions for today's biological purification needs. The Custom Resin section of this catalog describes how we are ready to solve future separation challenges. Whether it is a surface modification of an existing product or the creation of a new resin, we encourage you to contact us to provide you with a customized solution.

INTRODUCTION

THE SKILLS TOOLBOX

The science of biopurification is one of the fastest growing technologies in the world. Companies that accept the pace and are flexible will win. At Tosoh, we engineer: particle size, pore size, surface area, ligand chemistry, and innovation. The "Tosoh Resin Innovation Program" (TRIP) discussed in the "Custom Resin" section of this catalog describes our core technologies for solving customer problems.

CUSTOMER TRUST IS OUR NO.1 PRIORITY

Customer trust is earned, not given. Since 1987, Tosoh Bioscience has helped develop processes from benchtop discovery to multi-thousand liter manufacturing scale. A number of our process customers have been with us continuously for over 20 years. We have earned their trust. From development to new product launch we share in the excitement of our customers' successes, as well as their clinical disappointments.
In either case, Tosoh Bioscience uses its technology, innovation, and customer commitment to expedite the development process to build better customer relationships and trust for the future.

Let's start this process today!

WE LISTEN TO EVERY CUSTOMER REQUEST

Developing trust with our customers allows us to have very detailed discussions about individual customer needs. These discussions guide us in our understanding of emerging new product requirements and also the level of satisfaction the customer has with us as a company. We specialize in designing new products based on existing chemistries to solve specific customer applications.

Do you need a better HETP?
We can do it.

More dynamic binding capacity?
We can do it.

A new ligand immobilization?
We can do it.

Just ask us.
We will listen.

THE BEST EXPERIENCE FOR OUR CUSTOMERS

As your manufacturing partner we want our logistical support to be seamless to you. From your initial product evaluation to full scale manufacturing, our technical support, order administration, and final shipment procedures are in place to make your experience with us a thoroughly enjoyable one.
Courteous professionals are available to answer all of your questions. Our customer service processes are also in place to deliver our resins to you as agreed. Journal references, product specifications, samples, quotations, applications and scale up support are all just a telephone call, email, or mouse-click away.

Tosoh Bioscience works hard to make it easy for you to do business with us.

COMPLETE REGULATORY SUPPORT

Controlled production processes and auditable manufacturing facilities are the regulatory requirements of our industry. Well characterized, consistent resin products are as important to us as your therapeutic molecules with their known impurity profiles are to you. For this reason Tosoh Corporation's manufacturing site in Japan and both Tosoh Bioscience subsidiaries in the US and Europe are ISO 9001:2000 certified. Our manufacturing facilities are continuously audited by customers and we pass their tests. We maintain regulatory support information on our chromatographic resins available to our customers for their process registration needs.

Our resin processes are well controlled.

COMPREHENSIVE TECHNICAL SUPPORT

Do you need help developing an HPLC assay for the analysis of a new therapeutic target? How about monitoring the therapeutic's metabolites in the human body? Do you need help with a "self-packing" process column or a multi-thousand liter one? Our technical support specialists can provide assistance in all of these areas and more. We offer on-site training, application specific seminars, and are the sole sponsor of the HIC/RPC Bioseparation Conference series (www.HIC-RPC.org).

Do you need some help or training? Call us.
We'll be there for you.

INTRODUCTION

THE PRODUCTS TOOLBOX

From the research laboratory to full scale manufacturing, we offer the same polymer chemistries in our TSKgel and Toyopearl products (Table I). Whether you are scaling up from a TSKgel column HPLC method to Toyopearl for manufacturing, or are scaling down from a Toyopearl purification to the corresponding TSKgel column for the QC of your target, we make it easy to develop methods to do both.

TSKgel COLUMNS

Our TSKgel prepacked columns for high performance liquid chromatography are used for the analysis and purification of proteins, peptides, biopolymers and low molecular weight compounds. Many different chromatographic modes are offered including: size exclusion, ion exchange, hydrophobic interaction, reversed phase, affinity and normal phase chromatography. The column packing materials are either spherical silica or polymer particles, ranging in size from 2 µm to 30 µm. Columns are constructed of stainless steel, glass, or polyetheretherketone (PEEK) and are available from microbore to preparative sizes. Please see our website for more information.

TSKgel RESINS

The polymeric resins with particle sizes of 20 µm and 30 µm used in TSKgel columns are also available in bulk quantities for large scale ion exchange and hydrophobic interaction chromatography. Their mechanical stability and permeability make them excellent for use when increased separation performance and plate count are needed for optimum preparative or process chromatography.

TOYOPEARL RESINS

Toyopearl resins are hydrophilic macroporous methacrylic resins for large-scale chromatographic applications. Their rigid polymeric backbone has better pressure-flow properties than most other commercially made materials. Therefore, higher linear operating velocities can be used for faster process throughput and decreased recycling times. Toyopearl resins are stable over the pH 2-12 range for normal operating conditions and pH 1-13 for cleaning conditions. The resins are available in average particle sizes of 35 µm, 65 µm, 75 µm, and 100 µm for high resolution, intermediate purification, or capture chromatography. Toyopearl resins are also offered in many different pore diameters for size exclusion, ion exchange, hydrophobic interaction, and affinity chromatography.

INTRODUCTION

Pore diameter and surface area can be optimized to ensure excellent kinetic access and binding capacity of your target regardless of molecular size. For predictable results in scale-up, Toyopearl resins are based on the same chemistries as the prepacked TSKgel columns. This allows the seamless direct scale-up of methods developed on TSKgel products to Toyopearl.

TOYOSCREEN PROCESS DEVELOPMENT COLUMNS

ToyoScreen process development products are easy to use. They are available as 1 mL and 5 mL prepacked columns of your favorite Toyopearl hydrophobic interaction, ion exchange or affinity resins. They can be connected to most laboratory chromatographic systems for early development resin screening.

INTRODUCTION

SAFETY DATA AND WARRANTY

Tosoh Bioscience maintains Material Safety Data Sheets (MSDS for the U.S. and ERSDS for Europe) on all of its bulk resins. These data sheets contain pertinent information that you may need to protect your employees and customers against any known health or safety hazards associated with our products. Tosoh Bioscience supplies copies of our Material Safety Data Sheets with all bulk resins. You and your customers are responsible for knowing all information and precautions disclosed in the MSDS and any other available materials provided by Tosoh Bioscience which set forth information concerning our products. These describe precautions to be taken in the storage and handling of our products and in the maintenance of the health and safety of persons exposed to our products, the public and the environment with respect to our products. You and your customers should convey such information and precautions to the persons who may be exposed to our products.

We also suggest you contact your supplier of other materials recommended for use with our products for appropriate health and safety precautions prior to their use.

Many of the Toyopearl and TSKgel products have been assigned drug master file numbers by the FDA. Please direct inquiries to the Technical Service Department, Tosoh Bioscience GmbH, Zettachring 6, 70567 Stuttgart, Germany.

Tosoh Bioscience warrants that at the time of delivery each Product conforms to the specifications thereof contained in the Certificate of Analysis ("COA") or the Operating Conditions and Specifications ("OCS") sheet, as relevant, as is provided together therewith; provided, however, that the foregoing warranty applies only if the Products have been properly handled, stored and used by Buyer. Buyer acknowledges that the conditions of use and application by Buyer or its customers of any Product and technical information provided in connection therewith (whether verbal, written or by product evaluation) are beyond Tosoh Bioscience's control. Buyer agrees that it shall test such Product and technical information to determine to its satisfaction whether they are suitable for the intended use and applications of Buyer or its customers. All technical information shall be given without warranty or representation. Buyer assumes, and releases Tosoh Bioscience from, all liabilities, in contract, tort or otherwise, incurred in connection with the use or application of any Product or technical information provided in connection therewith (whether verbal, written or by product evaluation). THIS WARRANTY AND THE PATENT WARRANTY CONTAINED IN THE TERMS AND CONDITIONS ARE GIVEN AND ACCEPTED IN LIEU OF ANY OTHER WARRANTIES AND REPRESENTATIONS, EXPRESS OR IMPLIED, INCLUDING WITHOUT LIMITATION THOSE OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, OR NONINFRINGEMENT OF INTELLECTUAL PROPERTY RIGHTS. Please also see our terms and conditions for other conditions applicable to our warranty.

TECHNICAL DATA AND TRADEMARKS

The technical information and data herein contained (the "Technical Data") are based on information Tosoh Bioscience believes to be reliable and are offered in good faith, but are given without warranty or representation, as the conditions of use and application by you or your customers of our products and the Technical Data are beyond the control of Tosoh Bioscience. You should test our products and Technical Data to determine to your satisfaction whether they will be suitable for the intended use and applications of you or your customers. Suggestions for the uses of our products should not be understood as recommending the use of our products in violation of any patent or other intellectual property right or as permission or license to use any patent or other intellectual property right.

Toyopearl, ToyoScreen, TSK-GEL, TSKgel, Toyopearl MegaCap, and Toyopearl GigaCap are registered trademarks of Tosoh Corporation, the parent company of Tosoh Bioscience.

Triton is a registered trademark of Union Carbide Chemicals and Plastics Co., Inc.

Capto and Source are registered trademarks of GE Healthcare Bio-Sciences.

RETURN POLICY

Tosoh Bioscience is fully committed to delivering quality products and services. TSKgel column products are accompanied by a chromatogram demonstrating the performance of a test mixture on that column and by an OCS sheet that contains information about the Operating Conditions and Specifications of the column. TSKgel and Toyopearl media products are accompanied by Certificates of Analysis.

Despite our commitment to product quality, columns and resins occasionally perform differently than expected in a customer's application. Therefore, we ask you to inspect your TSKgel columns and Toyopearl media within 30 days of receipt by using the conditions described in the documentation supplied with the product. Let us know within this 30 day period if the product does not meet the specifications on the OCS (Operating Conditions and Specifications) sheet and QC document, or as listed in the Certificate of Analysis. Subject to prior authorization, we will accept for return all products that do not perform according to their specifications.

If laboratory TSKgel columns or media containers up to 1 L in size are authorized for return for reasons other than Tosoh Bioscience's error or because of a product defect, there will be a restocking charge of $ 50 or 10% of the list price, whichever is greater. Most 5 L and 50 L containers of bulk resin are packaged and made to order in Japan and are not returnable except for reasons of Tosoh Bioscience error or of product defect.

WHAT'S NEW

WHAT'S NEW

TOYOPEARL AF-rPROTEIN A-650F

The new Toyopearl AF-rProtein A-650F affinity resin is well-suited for high capacity capturing of immunoglobulins out of high titre feedstocks. It binds human and mouse immunoglobulin G (IgG), as well as Fab fragments. The resin combines a high h-IgG dynamic binding capacity at short residence time and fast mass transfer kinetics with an improved alkaline stability. It provides a typical dynamic binding capacity for IgG of more than 30 mg/ml resin at two minutes residence time. Thus, Toyopearl AF-rProtein A-650F offers the opportunity to improve process economics by increasing both, throughput and robustness.

A newly developed recombinant ligand has been engineered to maintain capacity even after repeated exposure to alkaline solution. Its multipoint attachment to the Toyopearl matrix further enhances chemical and thermal stability. In practice this pays off for a low level of protein A leaching and also for a high resistance to alkaline solutions employed in cleaning-in-place (CIP) procedures.

TOYOPEARL Q-600C AR

Toyopearl Q-600C AR is a new ion exchange resin with an average particle size of 100 µm. It is well-suited for high capacity capture of biotherapeutics or plasma proteins. 'AR' stands for alkaline resistance as the resin combines high dynamic binding capacity and fast mass transfer kinetics with an improved alkaline stability. Thus, Toyopearl Q-600C AR is enabling both, high process throughput and improved process robustness.

Toyopearl Q-600C AR has a slightly larger pore diameter than the well-established Toyopearl QAE-550C resin, but its ligand attachment chemistry creates significantly more dynamic binding capacities of > 100 mg BSA and 90 mg IgG per mL resin. It tolerates caustic cleaning solutions up to 1.0 mol/L NaOH well with essentially no change in dynamic binding capacity (DBC).

TSKgel SP-3PW

The new TSKgel SP-3PW (30) cation exchange resin was designed as a polishing resin with improved binding capacities for peptides and small proteins. It is a strong cation exchange resin having a smaller pore size than the corresponding TSKgel SP-5PW material and also a different selectivity.

Due to an average diameter of 30 µm and a very narrow particle size distribution it is ideally suited when resolution is an issue. Figure 1 shows a microscopic image of TSKgel SP-3PW (30) particles. The resin was developed to provide high DBCs for peptides and small proteins. A typical DBC of about 50 g/L for insulin makes this resin attractive for all peptide purification tasks that involve a cation exchange step.

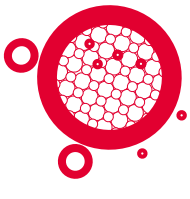
TOSOH FACT

Tosoh has a long history in size exclusion chromatography (SEC). In 1978 Tosoh first introduced porous silica-based SW columns for the isolation of proteins using LC. These first gels were quickly adopted and referred to as the standard for analytical SEC on FPLC and HPLC systems.

The first Toyopearl process resins for size exclusion chromatography were developed in 1979. Toyopearl HW resins are based on polymethacrylate and are available in various particle and pore sizes. They are used as starting material for the production of all other functionalized Toyopearl resins.



SIZE EXCLUSION CHROMATOGRAPHY

THE ROLE OF SIZE EXCLUSION CHROMATOGRAPHY IN PROCESS PURIFICATION

Size exclusion chromatography (SEC), also known as gel filtration, separates molecules in an aqueous mobile phase according to their physical size in solution as they pass through a porous structure. Molecules with a diameter greater than the largest pores within the resin material are unable to enter the particle. Because they are excluded from the pores they travel quickly through the column and elute first. Smaller molecules, which are able to access pores within the resin particles, permeate a larger accessible volume within the column and are eluted later, in order of decreasing molecular weight.

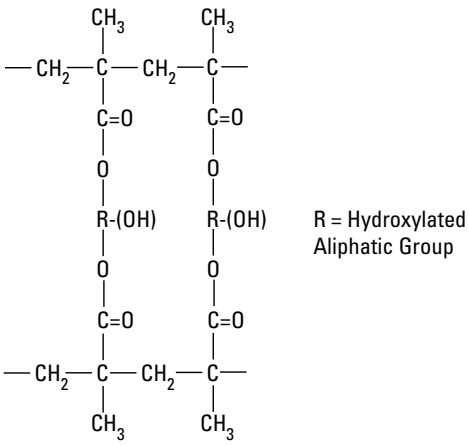
Because SEC has no adsorption capacity and its separation mechanism dilutes the sample upon elution, it is not normally used in the capture or intermediate steps of manufacturing processes. It is sometimes used as a final polishing step where a target protein is being separated from its aggregates or other significantly different molecular weight impurities. Another application area is the desalting of the purified target protein.

Tosoh Bioscience offers a number of Toyopearl HW-type products for size exclusion chromatography (Table I). These same SEC Toyopearl HW-type products are chemically modified with ion exchange groups, hydrophobic interaction or affinity ligands, to make the Toyopearl products shown in the later sections of this catalog.

Much of the information in this catalog section pertains to the available pore sizes, fractionation ranges, and particle sizes of the Toyopearl HW-type products, along with their physical and chemical properties. This data not only aids in the evaluation of the best resin for a SEC process step, but also lends insight into understanding the physical nature and the selection process of all Toyopearl resins.

FIGURE 1

RESIN CHEMISTRY OF TOYOPEARL SEC RESINS (HYDROXYLATED ACRYLIC)



RESIN CHEMISTRY

Toyopearl size exclusion resins are highly hydroxylated polymethacrylic polymer beads (Figure 1). Their surface hydroxyl groups render them very hydrophilic and useful for protein separations. Toyopearl products including the functionalized materials seen in later catalog sections, have the least non-specific binding of any chromatographic resin. This is of particular note for separations such as blood factors where backbone interactions with the feedstock may result in decreased recovery of the targets. Their semi-rigid polymeric nature also gives them better pressure-flow characteristics than softer materials such as agarose.

PORE SIZE

Commercial Toyopearl HW-type size exclusion materials are available in 5 pore sizes covering 5 different fractionation ranges. The choice of Toyopearl HW products depends on the molecular weight of the feedstock components. Tables I and II show this information for proteins, dextrans and PEG polymers.

FEATURES	BENEFITS
small particles available	high resolution
hydrophilic porous polymer structure	minimal non-specific adsorption effects
narrow particle size distribution	high performance SEC – more efficient separations better pressure-flow characteristics
good mechanical stability	excellent flow characteristics in large industrial size columns (up to 7 bar)
chemically stable (pH 2 – 14)	constant packing volume over a wide range of salt concentrations compatible with organic solvents, can be cleaned in place (CIP) with acid or base stable polymer may be run at elevated temperature (4° - 60°C) autoclavable at 121 °C
identical resin structure to TSKgel HPLC resins	direct scale-up from TSKgel HPLC columns

SIZE EXCLUSION CHROMATOGRAPHY

The Toyopearl HW-type resin range spans peptide and protein molecular weights between 100 - 50,000,000 Daltons. Each Toyopearl HW-type resin displays a typical calibration curve and exclusion limit for globular proteins (Figure 2).

Toyopearl HW-65 and HW-55 resins are the base beads for many Toyopearl products listed in the later sections of this catalog. A product having "-650" in its name uses the Toyopearl HW-65 resin for the base bead. Products having "-550" are derived from the Toyopearl HW-55 bead. The impact of pore size and its relationship to dynamic binding capacity and resin selectivity for a particular protein application is discussed in subsequent catalog sections.
See the hydrophobic interaction chromatography section of this catalog for Toyopearl PPG-600, Toyopearl Phenyl-600 and Toyopearl Butyl-600 resins which are functionalized on the Toyopearl HW-60 bead (not available for use in SEC).

PARTICLE SIZE

Resolution increases with decreasing particle size (Figure 3). Resin particle size is proportional to HETP and inversely proportional to the column efficiency and resolution of two peaks.

Most Toyopearl HW-type resins are available in three particle size ranges:

S-grade = 20 - 40 µm (Superfine)
F-grade = 30 - 60 µm (Fine)
C-grade = 50 - 100 µm (Coarse)

When the highest resolution is needed, the smaller S and F grade beads are preferred for process SEC. For desalting, where the resin is used in a filtration mode to remove the target from a buffer, the C grade is primarily employed because of its better flow dynamics at lower operating pressures.

Some Toyopearl HW-type products are also manufactured in "M-grade" (40-90 µm) and "EC-grade" (100-300 µm) to be used as the base beads for functionalized materials. These special grades are not commercially offered as SEC products. Please note that for the functionalized base beads in later catalog sections a "C-grade" is specified as a 50-150 µm bead and is not the SEC "C-grade" range of 50-100 µm.

Temperature: 25°C; Detection: UV @ 280 nm

SIZE EXCLUSION CHROMATOGRAPHY

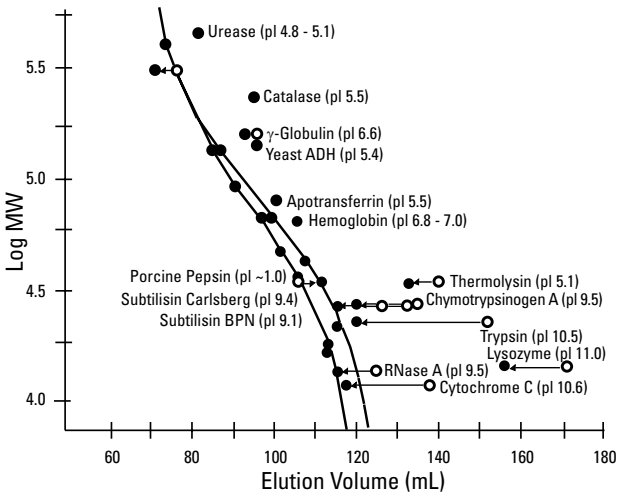
MOBILE PHASE

Mobile phase components, such as salts, can affect SEC separations. The presence or absence of sodium chloride influences the elution volume of proteins. This is demonstrated in Figure 4, in which a mixture of various proteins was separated on a column packed with Toyopearl HW-55F. Salt concentrations can change the hydrodynamic radius of proteins and either increase or decrease their molecular size as a function of salt strength. Ideally, in SEC sample components do not interact with the packing material. In practice it is often necessary to select a salt concentration which minimizes secondary interactions of the sample components with the resin. However, there are instances where secondary interactions, particularly hydrophobic interactions at higher salt concentrations, can be exploited.

It is important to note that relatively minor changes in protein structure may affect protein solubility and encourage secondary hydrophobic interactions causing similarly sized proteins or analogs to elute at different times. In those cases it may be necessary to modify the mobile phase composition to regain a separation based on molecular size alone.

FIGURE 4

COMPARISON OF THE ELUTION VOLUMES OF PROTEINS IN PRESENCE AND ABSENCE OF NaCl



Column: Toyopearl HW-55F, 22 mm ID x 50 cm L; Elution: 25 mmol/L Tris-HCl with or without 0.5 mol/L NaCl, (pH 7.5); Flow rate: 16 cm/h; Temperature: 5 - 10 °C; Detection: UV @ 280 nm, 420 nm for heme proteins, 200 nm for proteins without aromatic amino acid

PROPERTIES OF TOYOPEARL SEC RESINS IN AQUEOUS ELUENTS

- HIGH MECHANICAL STABILITY
  Toyopearl resins can be operated at pressures up to 3 bar without deformation.

- MINIMUM CHANGE IN GEL BED VOLUME
  Changes in the column bed volume under operational salt conditions are negligible. Toyopearl does not shrink or swell even in high concentrations of strong denaturing agents such as urea or guanidine hydrochloride.

- CHEMICAL STABILITY
  Toyopearl is stable from pH 2-13, and tolerant to pH 0-14 for short periods. Biomolecules which are only soluble at extreme pH values can be readily separated.

- SHARP CHROMATOGRAPHIC PEAKS
  Toyopearl's narrow particle size distribution (min. 80% – within declared limits) results in better peak shapes and higher elution target concentrations than other SEC materials.

- TEMPERATURE STABILITY
  Toyopearl is thermally stable and does not degrade or denature even in boiling water. Toyopearl resins can be sterilized by autoclaving at 121°C.

- MICROORGANISM RESISTANCE
  Toyopearl is an organosynthetic material, and is resistant to degradation by microorganisms.

- SUITABILITY FOR ENZYME IMMOBILIZATION
  Toyopearl resins contain numerous hydroxyl groups on the external and internal bead surfaces. These, in combination with the chemical stability of the polymer, make the resin well suited for the covalent bonding of enzymes or other ligands. (Please see the AFC section for more information.)

SIZE EXCLUSION CHROMATOGRAPHY

PROPERTIES IN ORGANIC ELUENTS

Toyopearl resins can be used in organic solvents or mixtures of organic solvents and water. Bed volumes may swell or shrink relative to water depending on the solvent as shown in Tables III and IV. DMSO can be used for SEC of oligosaccharides and polyethylene glycols. The compatibility of DMF with Toyopearl also permits SEC separation of hydrophobic substances such as polystyrenes.

All of the physical and chemical properties listed above for the Toyopearl HW-type series of SEC products makes them an excellent choice for use as the base beads for the ion exchange, hydrophobic interaction, and affinity chromatographic resins discussed in the later sections of this catalog.

OTHER APPLICATIONS

The Toyopearl HW-type resins are commonly used in size exclusion chromatography and desalting applications. Some other important uses of these materials are:

- Removal of surfactants such as Triton® X-100 from biological solutions by an adsorption mechanism
- Use in hydrophobic interaction chromatography (HIC) for the separation of very hydrophobic molecules
- Use in HIC separations as a guard column for hydrophobic impurities
- Possible use as a stationary phase for either normal or reversed phase separations depending on solvent system selected

TOSOH FACT

The Tosoh logo symbolizes the corporate philosophy of Tosoh's vision of the ideal.

The curved lines represent the realization of happiness, reflecting Tosoh's management philosophy of putting people first. The square in the center expresses the advanced nature of Tosoh's technology and also represents the outstanding quality of Tosoh's products. The right-angle cut at the top portrays an image of contributing to society, Tosoh's stance towards the outside world. The red corporate color symbolizes the Tosoh spirit, which guides the ceaseless efforts to realize the ideal.

ION EXCHANGE CHROMATOGRAPHY

TOYOPEARL ION EXCHANGE CHROMATOGRAPHY RESINS

Ion Exchange Chromatography (IEC) is the most common liquid chromatographic method used in manufacturing therapeutic proteins. Due to the high dynamic binding capacities of ion exchange resins relative to those of the other chromatographic modes (Table I), it is the chromatographic technique selected by many developers for the capture or concentration step. Tosoh Bioscience offers a broad range of products for ion exchange applications.

HOW DOES IEC WORK?

IEC is based on the binding of proteins to positively or negatively charged groups which are immobilized on a stationary phase and which are in equilibrium with free counter ions in the mobile phase. In the process of adsorption, the mobile phase counter ions are exchanged by the protein solute. The binding of proteins to the ion exchange matrix predominantly occurs via charged amino acid residues located at the surface of the protein molecule.

The development of optimum chromatographic system conditions requires knowledge of both the protein's pI and the pKa of the ion exchange media. A binding buffer pH is selected between the pI of the target and the ion exchanger's pKa (Figure 1). This ensures that the protein is in the opposite charge state compared to the ion exchange media. When possible, the pH is also optimized to effect the highest solubility of the target protein. Higher protein solubilities make more efficient use of the overall ion exchange capacity of the resin. A salt is selected as the source of counter ions in the mobile phase and elution occurs as the salt strength is increased to a higher concentration than the target's binding salt conditions.

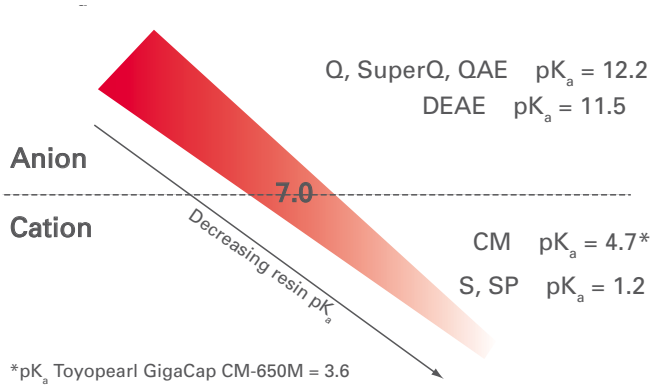
ION EXCHANGE GROUPS AVAILABLE

Toyopearl and TSKgel 5PW-type IEC resins are available with six different ion exchange groups as shown in Table II:

- 3 for anion exchange – Q, QAE, DEAE
- 3 for cation exchange – S, SP, CM

FIGURE 1

PK_a VALUES FOR ION EXCHANGE GROUPS



*pK_a Toyopearl GigaCap CM-650M = 3.6

TABLE I

Separation Mode	Binding capacity for standard proteins (mg/mL)	Binding capacity in production processes (mg/mL)
Ion Exchange	100-200	50-100
Hydrophobic Interaction	40-60	10-30
Affinity (group specific ligands)	40-100	20-60
Reversed Phase (polymeric media)	60-100	30-50

PORE SIZES

Tosoh Bioscience offers a range of pore sizes for IEC resins originating from our size exclusion chromatography base resins. Four different mean pore diameters are used for the current ion exchange resins: 1000 Å, 750 Å, 500 Å, and 250 Å (Table III). Depending on the kind of ligand attachment, the effective pore size of the resulting IEC resin is smaller than the pore size of the base bead. When network ligand technology is applied the accessible pore size is varying with pH and salt concentration, therefore all pore sizes mentioned here are those of the respective Toyopearl HW or TSKgel base resin.

FEATURES

- porous, hydrophilic polymer based resin
- chemical stability
- column bed stability
- mechanical stability
- continous selectivity

BENEFITS

- suitable for laboratory scale and process chromatography
- autoclavable at 121°C
- temperature range 4° - 60°C
- pH range 2-13, can be regenerated with acid or base
- compatible with organic sovents
- constant packing volume over a wide range of salt concentrations
- excellent flow characteristics in large industrial columns (up to 7 bar)
- easy scale-up from TSKgel IEC columns
- high yields of biologically active proteins

HIGHER ACCESSIBLE SURFACE AREA EQUALS MORE CAPACITY

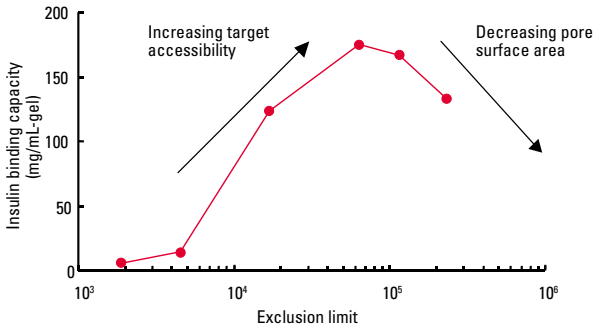
A bead with a small pore size has theoretically more surface area than the same size bead with a larger pore. Figure 2 shows insulin binding capacity on six different pore size beads. As the pore size increases to the point where the insulin has maximal access to the internal surface area the insulin capacity increases.

However, there is a point of diminishing return. Because the absolute surface area decreases as the pores become larger, the insulin capacity decreases accordingly. This effect is similarly demonstrated by the lysozyme static binding capacity range specifications of Toyopearl SP-550C and Toyopearl SP-650C which are 80-120 g/L and 35-55 g/L, respectively (data not shown).

For more information on pore size and particle size combinations not contained in our commercial products, please see the Custom Resin section of this catalog.

FIGURE 2

OPTIMIZATION OF INSULIN BINDING CAPACITY AS A FUNCTION OF PORE SIZE OF EXPERIMENTAL TSKgel SP-TYPE RESINS



ION EXCHANGE CHROMATOGRAPHY

MULTIPLE PARTICLE SIZES SIMPLIFY SCALING UP OR DOWN

Because Toyopearl HW-65 and TSKgel G5000PW products have similar backbone chemistry and selectivity, scaling up or scaling down for a selected ion exchange method is simple. Practically speaking, the chromatographic conditions that work for one particle size will work for all particle sizes with a given ligand functionality. The elution order of the feedstock components will remain the same with increasing resolution as the particle size gets smaller (Figure 3). Figure 4 lists the complete range of ion exchange products, particle sizes and suggests how they are typically placed into a manufacturing scheme. The availability of smaller bead sizes for greater resolution while maintaining the same selectivity is particularly useful in the areas of oligonucleotide and peptide purification.

RESIN PHYSICAL PROPERTY SELECTION

(for resins available in different pore sizes with the same ligand and ligand attachment chemistry)

For bind/elute chromatography:

- Select the smallest pore size resin appropriate for the size of the target molecule.
- Select a larger particle size for a capture step, a smaller one for intermediate or polishing steps

For flow through chromatography:

- If the target molecule's size is larger than most components of the feedstream, select a pore size which will tend to exclude it (known as kinetic exclusion, this technique can also be used under binding conditions as the excluded molecule only sees 1% of the resin surface area and the capacity/recovery loss is minimal)

For large molecule impurity clearance:

- Select a pore size which includes the target molecule, but excludes the impurity. (see the calibration curves of the Toyopearl base beads in the SEC section of the catalog as an aid).

OLIGONUCLEOTIDE PURIFICATIONS

Table 4 shows the different particle sizes available with the anion exchange SuperQ functionality, which is typically used for oligonucleotide purifications. The relative binding capacities and predicted resolution of the five particle sizes are depicted by a series of "+" characters. The more "+" characters listed in the table the better one resin is relative to another for that parameter. If a process is developed using one of the five resins and more resolution is needed, select an appropriate smaller particle size product. Similarly if more capacity is needed, and resolution is not a critical issue, a larger particle size resin can be selected. The larger particle Toyopearl resins are less crosslinked than the corresponding TSKgel 5PW type resin products and have more active sites for ligand attachment. Thus they have higher capacities than the TSKgel 5PW-type resins. In some cases, Toyopearl GigaCap Q-650M (also shown in Table IV) and its very high capacity can be used, although its selectivity is somewhat different than the other quaternary Q products.

TSKgel SuperQ-5PW products typically have 2-4 times the binding capacity of other small particle anion exchange resins available on the market. This has significant bearing in the area of difficult to resolve "n-1" DNA and RNAi purifications as loading amounts are increased. Under higher loading conditions, the TSKgel SuperQ resins maintain their resolution much better than smaller particle, lower capacity resins. The smaller particle products may start out with a slight separation advantage under low oligonucleotide loading conditions, but this vanishes as the feedstock load is increased.

Figure 5 shows a comparison of one smaller particle size, competitive product, which starts out having better resolution than TSKgel SuperQ-5PW (20) resin at 1 mg oligonucleotide/mL of resin. At 20 mg oligonucleotide/mL of resin, however, the resolution of peaks on the competitive product deteriorates significantly. The TSKgel SuperQ-5PW (20) retains excellent resolution even at this higher oligonucleotide level.

ION EXCHANGE CHROMATOGRAPHY

PEPTIDE PURIFICATIONS

Cation exchange chromatography is commonly used for peptide purification. Table 4 shows the same particle size availability of Toyopearl and TSKgel PW strong cation exchange resins. Based on the needs for capacity and resolution, an appropriate S or SP resin is selected for a particular peptide application. The new TSKgel SP-3PW (30) is based on a 250 Å pore resin. It was developed to provide high binding capacities for peptides and small proteins. It also has a different selectivitiy than TSKgel SP-5PW (30).

LIGAND ATTACHMENT TECHNOLOGY

Tosoh Bioscience applies three different ligand attachment chemistries reflecting three generations of ligand attachment technology. The "traditional" method, or first generation of attaching the ion exchange ligand, is directly to the resin surface through a proprietary spacer arm. Toyopearl and TSKgel PW type ion exchange resins using this traditional bead functionalization method are:

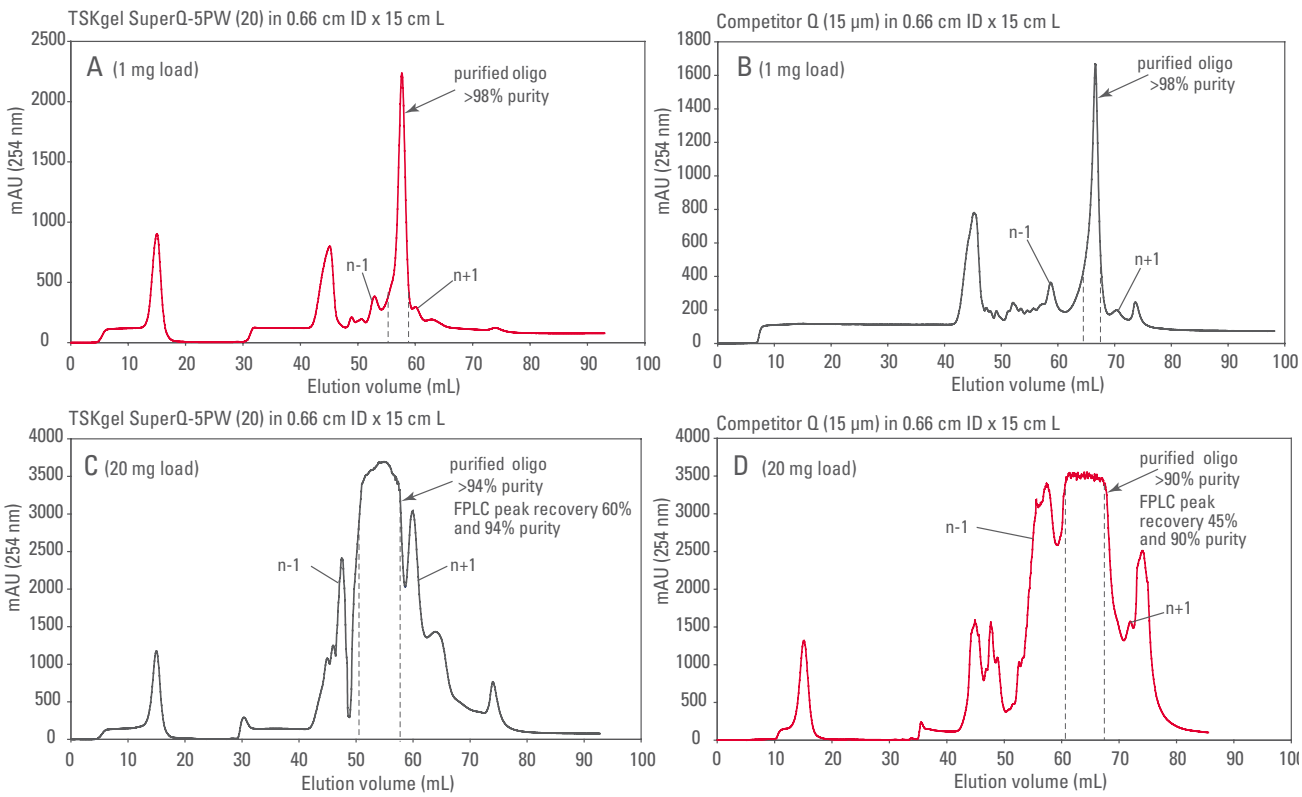
- Toyopearl SP-650 and SP-550
- TSKgel SP-3PW and SP-5PW
- Toyopearl CM-650
- Toyopearl Q-600C AR
- Toyopearl Q-550
- Toyopearl DEAE-650
- TSKgel DEAE-5PW
- Toyopearl MegaCap II SP-550EC

A second generation attachment chemistry (Type A noted in Table IV) for increasing protein binding within the accessible surface area, is to add a carbon spacer network between the bead surface and the ligand. It is also possible to attach ligand groups along the length of the spacer network thus improving capacity. There are two resins which incorporates this type A ligand attachment chemistry:

- Toyopearl SuperQ-650
- TSKgel SuperQ-5PW

FIGURE 5

TSKgel SuperQ-5PW (20) MAINTAINS RESOLUTION AT HIGH OLIGONUCLEOTIDE LOAD



Column: 0.66 cm x 15 cm L (5.1 mL) (resin as noted in figure); Flow rate: 1.43 mL/min (250 cm/h)
Buffer A: 20 mmol/L Tris-HCl + 10 mmol/L EDTA (pH= 9.0); Buffer B: 20 mmol/L Tris-HCl + 10 mmol/L EDTA + 1.0 mol/L NaCl (pH= 9.0)
Sample loaded: DNA based oligonucleotides were loaded as followed: 1 mg/column panels A & B, 20 mg/column panels C & D
Separation conditions: Column was washed with 5 CV 100% buffer A followed by 11 mL injection. Column was then washed with 3 CV 100% buffer A followed by 6 CV of linear gradient 35-53 buffer B. Finally, column was washed with 5 CV 100% buffer B.
Detection: UV @ 254 nm; Fractions: 0.5 mL fractions were taken from peaks of interest and analyzed on a TSKgel DNA-NPR column

ION EXCHANGE CHROMATOGRAPHY

A third generation ligand attachment chemistry (Type B noted in Table IV) improves the accessible location of the ligand groups. The result of this modification is significantly increased capacity and improved mass transfer. Improved mass transfer also reduces the target molecule elution volume. All Toyopearl GigaCap resins use this Type B ligand attachment chemistry:

- Toyopearl GigaCap S-650
- Toyopearl GigaCap CM-650
- Toyopearl GigaCap Q-650

Figures 6, 7, and 8 show the breakthrough curves for the three Toyopearl GigaCap resins. They are compared where possible with the most current equivalent competitive resin. Each trace shows the dynamic binding capacity of the resin up to 10% breakthrough plus the elution profile for the target molecule. Please note the significant reduction in elution pool volumes of the Toyopearl GigaCap resins when compared to other products. The concentration of the eluted peak is proportionally increased as well. It is possible to achieve reductions in elution pool volumes of over 75%. This can reduce the cost of further downstream process steps.

IMPACT OF PORE SIZE AND LIGAND ATTACHMENT ON DBC

Table 5 contains DBC data for five of our Toyopearl resins using three different sized proteins. There are three different pore sizes and three different ligand attachment methods represented. Toyopearl GigaCap Q-650M has the highest capacity for all combinations of pore size and attachment chemistries. Please note the decrease in capacity for the larger proteins on the Toyopearl SuperQ-650M resin indicating that the accessible pore volume has diminished by the ligand attachment chemistry used.

PEGylated PROTEINS

Ion exchange resins are frequently used for the purification of pegylated proteins. Figure 9 shows the breakthrough curves of five Toyopearl cation exchange resins for mono-pegylated lysozyme.

RESIN PRESSURE FLOW PROPERTIES

All Toyopearl resins are designed to withstand pressures up to 3 bar. The newer Toyopearl GigaCap resins have a particle size of 50-100 microns which is slightly larger than our normal M-grade 40-90 micron beads. This particle size difference generates a lower back pressure (Figure 10) than our more traditional M-grade ion exchange products. The TSKgel 5PW type resins can be operated at pressures up to 20 bar.

Column size: 6 mm ID x 40 mm L; Sample: polyclonal human IgG (1 mg/mL); Loading buffer: 50 mmol/L sodium acetate buffer (pH= 4.7); Elution buffer: 15 mmol/L Tris-HCl (pH= 8.7) + 1.0 mol/L NaCl Linear velocity: 212 cm/h; Detection: UV @ 280 nm

ION EXCHANGE CHROMATOGRAPHY

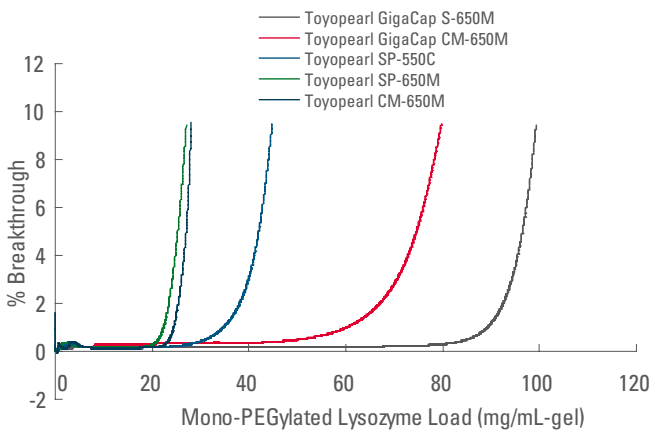
If recommended packing procedures are followed, Toyopearl and TSKgel IEC resins maintain stable bed volumes during the pH and ionic strength changes that occur during normal ion exchange chromatography (Consult our Toyopearl Instruction Manual for the recommended packing conditions). Multi-cycle gradient operation and re-equilibration are accomplished without volume changes in the Toyopearl column bed. The mechanical stability of Toyopearl resins allows the use of longer column beds with more efficiency or higher operational flow rates.

ALKALINE STABILITY

Tosoh has focused on improving the alkaline stability of its newer ion exchange resins. Higher capacity resins can bind not only more of the target molecule, but the impurities and isoforms as well. In some cases more rigorous cleaning agents like 0.5 mol/L NaOH and even 1.0 mol/L NaOH are needed to insure proper resin regeneration. Naturally, the resins need to tolerate these more stringent conditions. As seen in Table VI all three of the new Toyopearl GigaCap series ion exchange resins have excellent alkaline stability.

FIGURE 9

BREAKTHROUGH CURVES OF MONO-PEGYLATED LYSOZYME USING TOYOPEARL CATION EXCHANGE RESINS



Dynamic binding capacities were determined at 10% breakthrough
Column size: 6 mm ID x 40 mm L; Sample: mono-PEGylated lysozyme; Loading buffer: 20 mmol/L phosphate buffer (pH= 7.0)
Elution buffer: 20 mmol/L phosphate buffer (pH= 7.0) + 0.5mol/L NaCl
Linear velocity: 212 cm/h; Detection: UV @ 280 nm PEG MW= 5kDa

Detection: UV @ 280 nm

TOYOPEARL Q-600C AR

For this catalog we are announcing a new, high capacity anion exchange resin, Toyopearl Q-600C AR (using first generation ligand attachment chemistry). This new resin has a slightly smaller pore size than Toyopearl GigaCap Q-650M and has a typical BSA binding capacity of 100 mg/mL. As shown in Figure 11, after 100 days of exposure to 1 mol/L NaOH, its DBC remains unchanged. Figure 12 shows the preservation of selectivity after extensive exposure to caustic.

TOYOSCREEN PREPACKED COLUMNS FOR PROCESS DEVELOPMENT

ToyoScreen columns packed with the full range of our Toyopearl IEC products are available in 1 mL and 5 mL resin volumes. The ToyoScreen columns provide a convenient way to perform early resin screening for both target retention and recovery. Multiple columns can be connected in series for additional capacity or resolution. Please see the ordering information at the end of this section or contact us for more information on these products.

LABPAK

For scientists wishing to develop a better physical understanding of the packing properties of Toyopearl and TSKgel ion exchange resins, we offer Toyopearl LabPaks containing small volumes of the bulk resins. Please see the ordering information at the end of this section or contact us for more information on these products.

SUMMARY

Since 2007, major additions have been made to the Toyopearl ion exchange resins offered by Tosoh Bioscience. The Toyopearl GigaGap family of resins and the new Toyopearl Q-600C AR media represent significant improvements in terms of dynamic binding capacity, elution kinetics, and alkaline stability. When these products are used, process developers have more options available to design and optimize their process to improve productivity and lower operating costs.

TOSOH FACT

Tosoh Bioscience offers a range of technical support services to our TSKgel, ToyoScreen, and Toyopearl chromatography products.

Whether you need help developing an HPLC assay for the analysis of a new therapeutic target, want to know how to monitor drug metabolites in the human body or need regulatory files to support a submission to the FDA, our technical support specialists will provide assistance in all of these areas and more.

We offer on-site training and application-specific seminars and are committed to providing prompt and courteous service for these and other requests.

HYDROPHOBIC INTERACTION CHROMATOGRAPHY

TOYOPEARL RESINS FOR HYDROPHOBIC INTERACTION CHROMATOGRAPHY

Hydrophobic interaction chromatography (HIC) is a powerful tool for the process purification of biomolecules. The technique utilizes the accessible hydrophobic regions located on protein surfaces and their interactions with a weakly hydrophobic stationary phase. HIC is an excellent complement to ion exchange (IEC) and size exclusion chromatography (SEC) particularly when protein isoforms exist or when feedstock impurities are of similar isoelectric point or molecular weight. The selectivity differences exploited by HIC can also be used after affinity separations in which closely related proteins with similar recognition sites are not distinguishable by the affinity ligand.

HOW DOES HIC WORK?

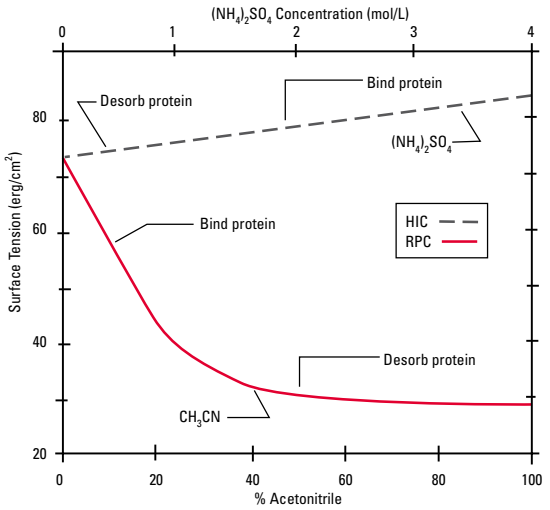
Proteins and other molecules with hydrophobic surfaces are attracted to the hydrophobic ligands of both reversed phase (RPC) and HIC resins. RPC resins have higher surface coverage and/or more hydrophobic ligand compared to HIC resins. Because of this, in a RPC separation the target binding readily occurs in an aqueous solution, and desorption is promoted by the addition of an increasing amount of organic solvent.

In HIC, proteins are bound to the resin by employing an aqueous high salt mobile phase. The salt conditions contribute to a lyotropic effect which allows the proteins to bind to the lower surface coverage of a hydrophobic ligand. Proteins are eluted by the simple technique of decreasing the salt concentration. Most therapeutic targets are eluted in a low salt or a no salt buffer.

During elution the energy of interaction for a HIC step is less than that of a RP step. One means of gauging the relative binding energy between the two techniques is to measure the surface tension of the two sets of binding and elution conditions. Figure 1 provides a comparison of the surface tension generated by HIC and RPC elution systems. Since HIC separates under milder eluting conditions, biological activity is typically retained.

FIGURE 1

SURFACE TENSION OF AQUEOUS SOLUTIONS USED IN HIC & RPC



Mode	Gradient (typical)	Δ Surface tension (erg/cm^2)
HIC	1.8 to 0 mol/L $(NH_4)_2SO_4$/ aqueous buffer	4
RPC	10 to 50% ACN/ 0.1%TFA	23

C. Horvath et. al., Separation Processes in Biotechnology, (J. Asenjo, Ed.) 9, 447 (1990) Marcel Dekker

FEATURES

- hydrophilic polymer resin matrix
- good mechanical stability

BENEFITS

- robust chemical stability between pH 1 - 13
- temperature range 4 - 60°C
- autoclavable at 121°C
- compatible with organic solvents
- constant bed volume over a wide range of salt concentrations
- low non specific protein binding
- superior protein recovery
- excellent flow characteristics in large industrial size columns
- direct scale-up from TSKgel HIC HPLC columns

HYDROPHOBIC INTERACTION CHROMATOGRAPHY

FIVE DIFFERENT HYDROPHOBIC SURFACES AND SELECTIVITIES

Tosoh Bioscience offers five HIC ligands featuring different degrees of hydrophobicity and selectivity. The hydrophobicity of Toyopearl HIC resins increases through the ligand series: Ether, PPG (polypropyleneglycol), Phenyl, Butyl, and Hexyl. (Figure 2)

Coordinating the hydrophobicity of the therapeutic target to the resin hydrophobicity is critical for the best overall purification performance. Too hydrophobic a resin for a given protein can result in its irreversible binding to the resin or a loss of enzymatic activity. Table I and II show typical mass recovery and biological activity recovery data for Toyopearl HIC resins.

An optimum HIC process step will balance high dynamic binding capacity, adequate selectivity, good mass recovery and retention of biological activity. The wide range of Toyopearl selectivities enables a developer to optimize protein separations at the extremes of the hydrophobic spectrum. Highly retentive Toyopearl Hexyl-type and Toyopearl Butyl-type resins are used to separate hydrophilic proteins. These two resins should also be considered for separations requiring a low salt environment. Toyopearl Ether-type resin is used for the purification of very hydrophobic targets such as certain monoclonal antibodies and membrane proteins. These proteins may bind irreversably to other more hydrophobic resins. Toyopearl PPG-type and Toyopearl Phenyl-type phases complement the other HIC ligands available in the Toyopearl series and offer alternatives for mid-range hydrophobic proteins.

FIGURE 2

HIC LIGAND CANDIDATES

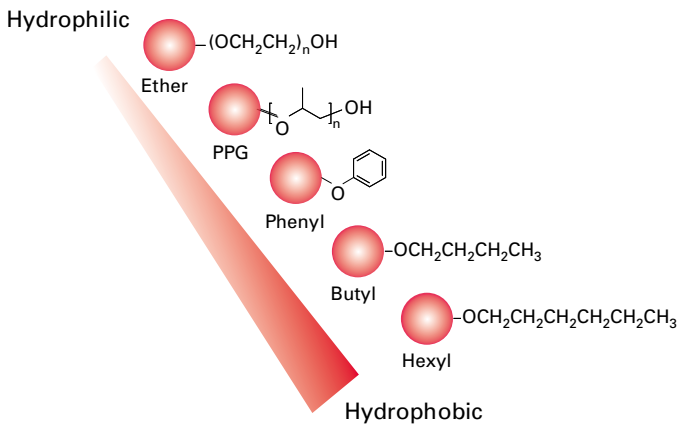


TABLE I

HIGH MASS RECOVERY (%) OF PROTEINS

	Toyopearl HIC resin		
	Ether-650M	Phenyl-650M	Butyl-650M
Bovine serum albumin	84	62	76*
α-chymotrypsinogen	96	88*	90
Cytochrome C	-	81*	87*
IgG	91	-	-
α-Lactalbumin	90	-	-
Lysozyme	94	92	85
Ovalbumin	83	88	73
Ribonuclease A	-	72*	82*

*Procedure: A 200 mL sample containing 200 mg of protein was loaded onto a 7.5 mm column and eluted with a 60 minute gradient of 1.8 mol/L (*1.5 mol/L) to 0.0 mol/L ammonium sulfate in 0.1 mol/L sodium phosphate (pH 7.0). The mass recovery was determined spectrophotometrically at UV 280 nm and 25°C.*

TABLE II

RECOVERY OF ENZYMATIC ACTIVITY OF PROTEINS

Toyopearl HIC resin	Protein	% Activity recovery
Phenyl-650	Phytochrome	79
Butyl-650	Halophilic protease	85
Butyl-650	Poly (3-hydroxybutyrate) depolymerase	88
Butyl-650	Aculeacin-A acylase	82
Butyl-650	Opine dehydrogenase	81

HYDROPHOBIC INTERACTION CHROMATOGRAPHY

The retention and selectivity of protein standards on Toyopearl HIC resins using the ToyoScreen process development columns are shown in Figure 3.

INFLUENCE OF SALT TYPE

In addition to the hydrophobicity of the ligand, the selectivity in HIC is influenced by the eluent salt type. Figure 4 demonstrates the effect of salt type on the resolution factor of different protein pairs.

The Hofmeister lyotropic salt series shown in Figure 5 ranks anions and cations by their ability to promote protein precipitation. Ions on the left are referred to as "lyotropic" while the ions on the right are called "chaotropic".

Lyotropic salts will precipitate or "salt out" proteins at high salt concentrations due to increased hydrophobic interaction, while chaotropic salts will promote protein denaturation at high salt concentrations. Figure 5 indicates that different salt systems may generate a variety of adsorption and desorption selectivities for each resin. This feature of HIC provides an additional parameter for the optimization of a process step.

FIGURE 5

HOFMEISTER LYOTROPIC SALT SERIES

For anions
SO_4^{2-} > HPO_4^{2-} > CH_3COO^- > halide > NO_3^- > ClO_4^- > SCN^-

For cations
$(CH_3)_4N^+$ > NH_4^+ > K^+ > Na^+ > Cs^+ > Li^+ > Mg^{2+} > Ca^{2+} > Ba^{2+}

Ammonium sulfate and sodium sulfate are the most commonly used salts in HIC. NaCl is often used as well.

HYDROPHOBIC INTERACTION CHROMATOGRAPHY

PARTICLE SIZE OPTIMIZATION

Toyopearl and TSKgel PW-type methacrylic base beads incorporate the same polymer chemistry (see Figure 6 or refer to SEC section for a more detailed discussion) and are available in a variety of particle sizes:

100 µm	Toyopearl C-grade	Capture
65 µm	Toyopearl M-grade	Intermediate Purification
35 µm	Toyopearl S-grade	Intermediate Purification/Polishing
30 & 20 µm	TSKgel PW-type	High Resolution

In many cases analytical columns are available packed with 10 micron particles having the same selectivity as the process media. Figure 7 shows the variety of ligands and particle sizes available for HIC process-scale applications. This figure also depicts where each particle size is used in a chromatographic manufacturing train (i.e. for capture, intermediate purification, or polishing).

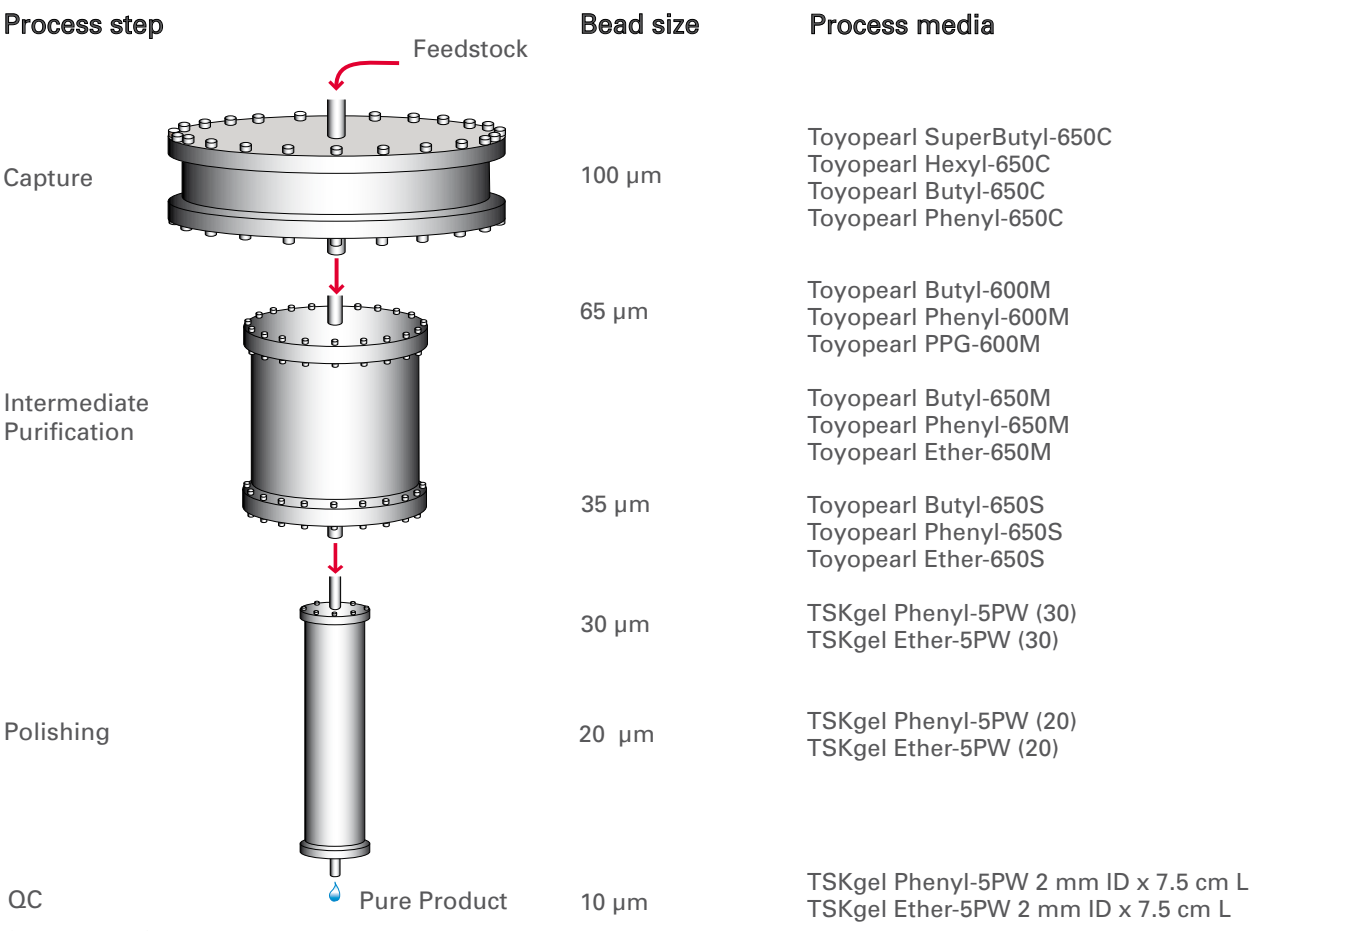
MECHANICAL STABILITY

The semi-rigid polymeric backbone of Toyopearl and TSKgel HIC resins permits high flow rates for maximum throughput and productivity. Toyopearl resins may be operated up to 3 bar and TSKgel PW-type resins may be operated up to 20 bar. The pressure-flow characteristics for each particle size grade of Toyopearl Phenyl-650 resins are shown in Figure 8. The beads are compatible with both fixed bed and dynamic axial compression columns.

CHEMICAL STABILITY

The polymeric structure of these products also makes them resistant to a wide range of pH conditions and ionic strengths. In addition, the hydroxylated surface of the base bead reduces non-specific binding of proteins.

FIGURE 7



Same selectivity HPLC columns are available for most process media

HYDROPHOBIC INTERACTION CHROMATOGRAPHY

PORE SIZE OPTIMIZATION

Most Toyopearl HIC products are derived from the versatile size exclusion resin, Toyopearl HW-65 (1,000 Å mean pore size), as the base bead for the majority of protein separations. But the pore size and accessible surface area of Toyopearl resins can be optimized for a given protein. More accessible surface area increases the dynamic binding capacity (DBC) of the bead for a particular therapeutic target. This has led to the development of two specialty lines of HIC materials with higher dynamic binding capacities.

HIGH DYNAMIC BINDING CAPACITY TOYOPEARL PROCESS RESINS

For monoclonal antibodies a pore size of 750 Å is optimum. A specially made base resin, Toyopearl HW-60, has this pore size. Three ligands are available on Toyopearl HW-60: polypropylene glycol (PPG), phenyl, and butyl. A comparison of their DBCs with Toyopearl Phenyl-650M resin is shown in Figure 9. The selectivities of Toyopearl Butyl-600M, Toyopearl PPG-600M and the Toyopearl Phenyl-600M resins, are shown in Figure 10.

Linear velocity: 136 cm/hr; Temperature: 25 °C
Detector: UV @ 280 nm

HYDROPHOBIC INTERACTION CHROMATOGRAPHY

Figure 11 compares the selectivities of the Toyopearl Phenyl-600M, Toyopearl Phenyl-650M and an Agarose Phenyl resin.

For smaller molecules such as lysozyme (12,000 Da) the even narrower pore diameter Toyopearl SuperButyl-550C resin (derived from the 500 Å pore diameter Toyopearl HW-55) is recommended. A comparison of the DBC of Toyopearl SuperButyl-550C with other Toyopearl HIC resins is shown in Figure 12.

The Toyopearl Phenyl-600M resin also has a high DBC for lysozyme (Figure 13). The engineered higher dynamic binding capacity of the 600 and 550 series HIC products for their specific targets and the selectivity differences induced by the smaller mean pore size of the respective beads can have a dramatic impact on process economics.

TOYOSCREEN PREPACKED COLUMNS FOR PROCESS DEVELOPMENT

ToyoScreen columns packed with the full range of our Toyopearl HIC products are available in 1 mL and 5 mL resin volumes. They provide a convenient way to screen different resins for both target retention and recovery. Multiple columns can be connected in series for additional separation. Please see the ordering information at the end of this section or contact us for more information on these products.

HYDROPHOBIC INTERACTION CHROMATOGRAPHY

MONOCLONAL ANTIBODIES

Hydrophobic interaction is a very useful technique for the purification of monoclonal antibodies. The diverse hydrophobic nature of mAbs is seen in Figure 14. This figure measures the hydrophobicity (using elution time as a surrogate measurement) of 51 different mouse IgGs on a TSKgel Phenyl-5PW analytical column. Some of the IgGs have elution times 2-3 times longer than others indicating greater hydrophobicity. The Toyopearl series of HIC ligands (Figure 2, page 33) with their different hydrophobicities gives chromatographic developers a range of options for finding the right ligand for their target molecule.

For a very hydrophobic mAb, such as mouse anti-chicken 14 kDa lectin, the less hydrophobic Toyopearl Ether ligand works quite well. The purification from ascites fluid (Figure 15) was performed with a 10 µm TSKgel Ether-5PW semi-preparative column. Identical selectivity for scale-up was found with corresponding 65 µm Toyopearl Ether-650M resin.

HYDROPHOBIC INTERACTION CHROMATOGRAPHY

PROTEIN AGGREGATE REMOVAL

The larger pore Toyopearl products such as Toyopearl Butyl-650 and Toyopearl Phenyl-650 resins are very useful for protein aggregate separation and removal. Early work by Karger et al[1] in 1989 involving proteins and aggregates larger than 200 kDa demonstrated the effectiveness of HIC for this application.

GLYCOPROTEINS

Toyopearl HIC resins can purify glycoproteins, which often bind irreversibly to saccharide-based chromatographic media. Figure 16 shows the purification of a large glycoprotein on Toyopearl Butyl-650S resin.

DNA PLASMID PURIFICATION AND ENDOTOXIN REMOVAL

Toyopearl Hexyl-650C resin was successfully used for plasmid DNA purification by Cambrex, Baltimore, MD (US patent 6,953,686). Hexyl-650C was shown to be the most effective among HIC resins for endotoxin removal with capacities exceeding 2 million EU/mL of resin. Additionally, RNA and protein impurities were effectively eliminated. Hexyl-650C was also effective in separating the supercoiled and open circular forms of plasmid DNA.

REMOVAL OF MISFOLDED PROTEINS

Because misfolded proteins will generally be more hydrophobic than the native protein, Toyopearl Butyl-650M resin is used frequently for the removal of misfolded proteins. In many cases flow through chromatography can be accomplished under eluent conditions binding the misfolds while allowing the target to flow through the column.

TOSOH FACT

Tosoh Bioscience GmbH offers workshops on chromatography in process development & production. These three day courses deliver a comprehensive background to bioprocess chromatographic purification as an integrated process technique. The workshops provide a balance of effective presentations and practical hands-on experience with process scale and methods development equipment under the guidance of qualified and knowledgeable Tosoh Bioscience technical experts. Every year more than 30 participants use this opportunity to broaden or refresh their chromatographic and downstream processing knowledge.

AFFINITY CHROMATOGRAPHY

TOYOPEARL AFFINITY RESINS FOR PROCESS SCALE CHROMATOGRAPHY

There are many custom designed affinity ligands available to the chromatographer. Toyopearl affinity chromatography resins are functionalized with chemically active groups or group-specific ligands. Resins with activated functional groups are ready to directly couple a protein or other ligand. Resins with reactive groups require carbodiimide coupling or reductive amination to achieve a stable covalent linkage. The latest development in Toyopearl affinity resins is the high capacity Protein A affinity resin Toyopearl AF-rProtein A-650F developed to increase productivity in antibody purification.

PRESSURE-FLOW CHARACTERISTICS AND PHYSICAL/ CHEMICAL STABILITY

Toyopearl resins remain dimensionally stable within wide extremes of pH and ionic strength. Moreover, the semi-rigid Toyopearl particles do not distort under flow rates that generate up to 3 bar pressure. These properties of the resins combined with the narrow particle size distributions result in superior pressure-flow characteristics for the packed Toyopearl bed. Linear velocities of 300 - 500 cm/h generate a pressure of between 1 and 2 bar in a 20 cm length bed. Achievement of high linear velocities at relatively low pressure enables high throughput production scale chromatography using equipment with moderate pressure limitations. Sanitization or cleaning may be conducted with up to 0.5 mol/L NaOH or 0.5 mol/L HCl depending upon the ligand. In affinity chromatography, in particular, the choice of cleaning agent will be largely dependent upon the chemical stability of the ligand, rather than that of the base resin.

TOYOPEARL RESIN FOR PROTEIN A AFFINTIY CHROMATOGRAPHY

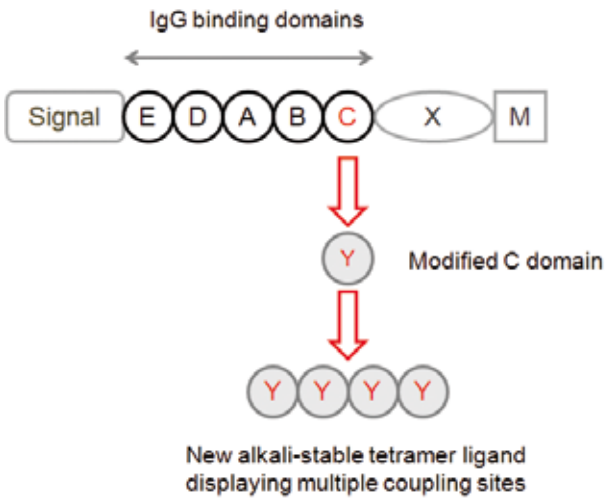
Toyopearl AF-rProtein A-650F is an affinity resin designed for efficient and robust large-scale purification of monoclonal antibodies. A newly developed recombinant protein A ligand (E. coli) was linked to the well proven methacrylic polymer backbone of Toyopearl media. The ligand is derived from one of the IgG-binding domains of the *staphylococcus aureus* protein A (Figure 1). Its amino acid sequence was optimized in order to increase its stability towards alkaline solutions.

Multipoint attachment of the ligand to the Toyopearl matrix further enhances chemical and thermal stability of the resin. In practice this pays off for a low level of protein A leaching and also for a high resistance to alkaline solutions employed in cleaning-in-place (CIP) procedures.

Toyopearl AF-rProtein-650F binds human and mouse immunoglobulin G, and Fab fragments.

FIGURE 1

RECOMBINANT PROTEIN A DERIVED LIGAND



FEATURES

- Active, reactive and group specific resins
- New high capacity AF-rProtein A resin
- Standard 1.000 Å pore size
- Porous, hydrophilic polymer matrix
- High mechanical stability

BENEFITS

- Broad range of applications
- Efficient antibody purification
- High capacity for large biopolymers
- Suitable for laboratory and process scale purifications
- Constant bed volume over a wide range of buffer composition

AFFINITY CHROMATOGRAPHY

HIGH BINDING CAPACITY AT SHORT RESIDENCE TIME

The particle size of 45 µm and the ligand density of Toyopearl AF-rProtein A-650F were optimized in order to reach high dynamic binding capacities (DBC) for immunoglobulins. Typical static IgG binding capacity is > 45 mg/ml resin and typical dynamic IgG binding capacity at 10 % breakthrough is > 30 mg/mL resin at 2 minutes residence time (1 mg/mL protein load). Fast mass transfer kinetics support high binding capacities even when applying high titer feedstocks at high flow rates. IgG breakthrough curves (Figure 2) at various linear velocities demonstrate the high IgG DBC at high velocities and the superior kinetic performance of Toyopearl AF-rProtein A-650F.

HIGH CIP AND SANITIZATION STABILITY

The structure of the recombinant ligand and its multipoint attachment to the base matrix enhances the stability of Toyopearl AF-rProtein A-650F in 0.1 - 0.5 M NaOH. The dynamic binding capacity remains high after repeated CIP cycles. After more than 150 CIP cycles with 0.1 M NaOH at 16 min contact time per cycle more than 90 % of initial dynamic binding capacity was retained (Figure 3). When performing cleaning-in-place with 0.5 M NaOH about 80 percent of IgG binding capacity remain after 50 cycles with 17 min contact time.

Toyopearl AF-rProtein A-650F is also stable in ethanol, 6 M urea, 6 M guanidinium chloride, and 1% phosphoric acid, respectively. Static binding capacity of the resin is not impaired when heated for 30 minutes to temperatures of up to 90°C. It can be stored at room temperature at production site. Recommended conditions for long term storage are a storage solution of 20 % ethanol and temperature of 4 - 8 °C.

AFFINITY CHROMATOGRAPHY

TOYOPEARL RESINS FOR AFFINITY LIGAND COUPLING

Toyopearl offers a spectrum of carefully selected affinity resins primed with activated or reactive groups which can be used to covalently attach almost any custom ligand. The structures of Toyopearl activated and reactive ligands are shown in Figure 4.

In general, Toyopearl AF-Tresyl-650M and Toyopearl AF-Formyl-650M resin are recommended for coupling proteins, while Toyopearl AF-Epoxy-650M resin is suited for coupling lower molecular weight ligands. Toyopearl AF-Amino-650M and Toyopearl AF-Carboxy-650M resins may be used for both.

Toyopearl affinity resins may be used in combinatorial chemistry or for solid phase synthesis of peptides and oligonucleotides because of their excellent stability in a variety of organic solvents and under extremes of pH.

AFFINITY CHROMATOGRAPHY

ACTIVATED RESINS – READY FOR DIRECT LIGAND ATTACHMENT

Toyopearl AF-Tresyl-650M activated resin is highly reactive toward amine and thiol groups. It is provided in dry form, ready for reaction in buffered solutions containing protein or other ligand. Coupling is accomplished in neutral to slightly alkaline (pH 7 - 8) solution (Figure 5).

Under such conditions, even proteins of limited stability may be successfully coupled. Coupling leads to the formation of a highly stable secondary amine or thio-ether linkage. The optimized tresyl-density (ca. 20 µmol/mL hydrated resin) is sufficient to provide substantial protein binding while avoiding excessive multi-point attachment and consequent impairment of ligand affinity/activity. Representative data are presented in Table II.

Toyopearl AF-Epoxy-650M activated resin, also packaged in dry form, has a high density of epoxy- functionality (ca. 800 µmol/mL). Under appropriate reaction conditions, this may be used for immobilization of proteins or low molecular weight ligands. It is particularly useful when high densities of low molecular weight ligands must be attached (Figure 6). Glutathione and glycine have, for example, been coupled at densities greater than 100 µmol/mL hydrated resin.

Toyopearl AF-Epoxy-650M resin is a highly versatile starting material for conversion to other chemically active functional groups required in special applications. This resin may be readily activated to hydrazide-bearing materials. This is particularly useful for immobilization of carbohydrates or glycoproteins. Using the reaction sequences described, special ligands may be introduced onto this dimensionally stable, macroporous support.

AFFINITY CHROMATOGRAPHY

REACTIVE RESINS - REQUIRE ACTIVATION FOR LIGAND ATTACHMENT

Ligands may be coupled to Toyopearl AF-Formyl-650M (aldehyde-bearing) resin under mild conditions exclusively using primary amines. The ligand is bound to the resin by a stable secondary amine linkage (Figure 7). Representative coupling capacities are shown in Table II.

A wide variety of industrial enzymes have been immobilized on aldehyde-bearing supports. Typically, these supports have been synthesized by industrial users by partial oxidation of polysaccharide supports (e.g. cellulose and agarose) or partial hydrolysis of polyacetals. In contrast, Toyopearl AF-Formyl-650M resin is a ready-to-use aldehyde support formulated from a dimensionally stable, macroporous matrix. Consistent aldehyde content and physical properties are assured from batch to batch.

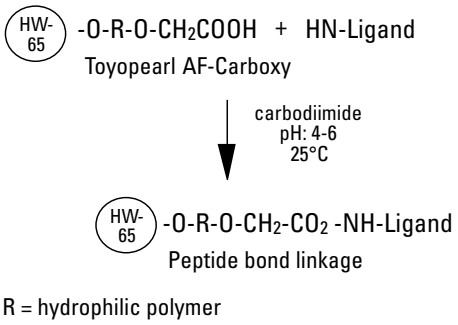
Toyopearl AF-Amino-650M resin may be used to couple ligands using their carboxyl groups (peptide bond formation) or aldehyde groups (reductive amination) as shown in Figure 8. Aldehyde groups may be present in a carbohydrate or glycoprotein ligand or may be introduced into the ligand by mild, periodate oxidation.

The optimized functional group density of Toyopearl AF-Amino-650M (100 µmol/mL) is ideal for coupling of either proteins or low molecular weight ligands. For example, lactose was coupled by reductive alkylation to yield a ligand density of ca. 30 µmol/mL resin. Coupling densities for various proteins are given in Table II.

Toyopearl AF-Carboxy-650M resin provides another useful and milder approach for coupling to amino groups of proteins or low molecular weight ligands. The carbodiimide mediated coupling reaction produces an amide bond between ligand and support (Figure 9). Representative coupling densities are given in Table II.

FIGURE 9

TOYOPEARL AF-CARBOXY COUPLING PROCEDURE



TOYOPEARL RESINS WITH GROUP SPECIFIC LIGANDS

The structures of Toyopearl group specific ligands are shown in Figure10.

Toyopearl AF-Chelate-650M

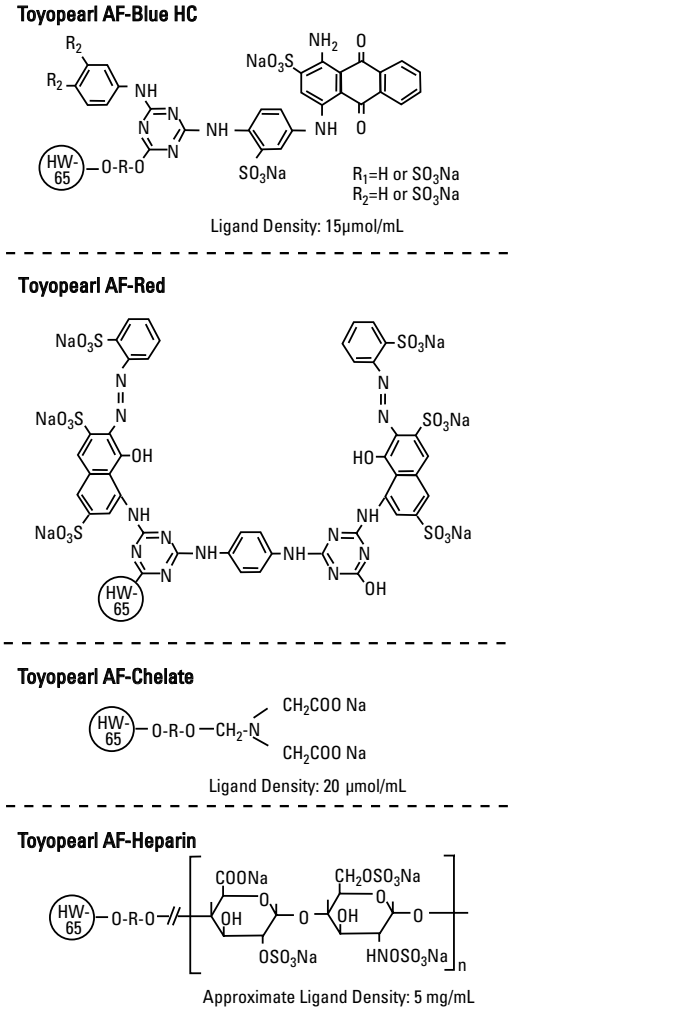
This resin is derivatized with iminodiacetic acid (IDA) at a concentration of ca. 20 µmol/mL. In typical applications, selected metal ions, most often Ca^{2+}, Ni^{2+}, Zn^{2+}, Co^{2+} and Cu^{2+} are bound to the support by stable chelation. The resultant metal ion-bearing resin binds to histidine and free cysteine containing sequences of a peptide or protein. Immobilized metal ion affinity chromatography (IMAC) has been used for purification of recombinant human growth factor, tissue plasminogen activator, glycophorins, and whole cells.

Toyopearl AF-Blue HC-650M

Functionalized with Cibachron Blue F3G-A, Toyopearl AF-Blue HC-650M resin has excellent capacity for proteins, particularly albumin (Figure 10). In addition, this high capacity resin has improved caustic stability, reduced dye ligand leakage, and superior pressure-flow characteristics relative to more traditional agarose materials (Figure 11).

FIGURE 10

GROUP-SPECIFIC TOYOPEARL AFFINITY RESIN



AFFINITY CHROMATOGRAPHY

Toyopearl AF-Red-650ML

Toyoscreen and Toyopearl AF-Red-650ML resins are functionalized with Procion Red HE-3B, (also known as Reactive Red 120). This resin is useful for the purification of nucleotide dependent enzymes, lipoproteins, plasminogen, peptides, hormones and cytotoxins.

These two dye-ligand resins are useful in binding/purification of nucleotide-dependent enzymes, albumin, cell growth factors, interferons, transferases, cyclases. and polymerases. Typical binding capacities are shown in Table III.

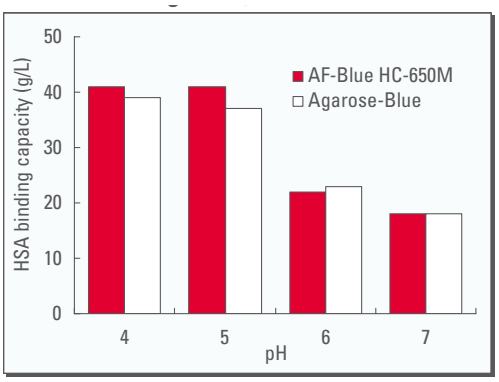
FIGURE 11

COMPARISON OF HUMAN SERUM ALBUMIN BINDING CAPACITIES AT VARIOUS pH'S OF AF-BLUE HC-650M AND AGAROSE (BLUE FUNCTIONALIZED AGAROSE)



Conditions

- A 1.0 mL of adsorbent was washed with 10 mL of equilibration buffer (pH 4.0 and 5.0; 0.1 mol/L sodium acetate buffer, pH 6.0 and 7.0; 0.1 mol/L sodium phosphate buffer).
- A 5.0 mL of 1 % solution of human albumin desolved in each equilibration buffer was charged onto the column.
- After 10 min, unbound albumin was eluted and the column was washed with 10 mL of each equilibration buffer.
- Adsorbed human albumin was eluted with 0.1 mol/L sodium phosphate buffer at pH 7.0 containing 2.0mol/L sodium chloride (desorption buffer) and 10 mL fractions were collected.
- Human albumin content was measured spectrophotometrically by using E 0.1% at 280 nm = 0.55.

Toyopearl AF-Heparin HC-650M

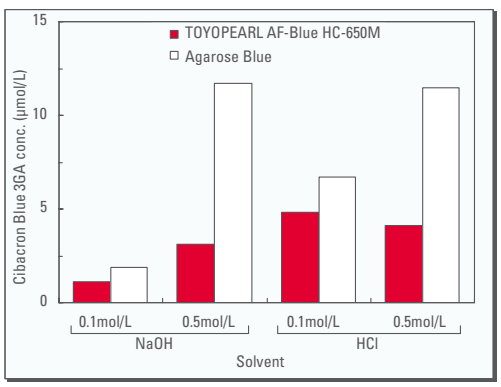
Heparin is a linear and highly sulfated glycosaminoglycan which has anti-coagulant properties. Due to its polyanionic nature, heparin interacts with a wide range of biomolecules including plasma components, lipoprotein lipase, collagenase, and DNA polymerase.
Immobilized heparin is widely used as an adsorbent in affinity chromatography for the purification of biological substances. Toyopearl AF-Heparin HC-650M resin is a high capacity, affinity adsorbent with excellent chemical stability.

TOYOSCREEN PREPACKED COLUMNS FOR PROCESS DEVELOPMENT

ToyoScreen columns are available in 1 mL and 5 mL resin volumes of the following Toyopearl AFC products: Toyopearl AF-Chelate 650M, Toyopearl AF-Heparin HC-650M, Toyopearl AF-Blue HC-650M and Toyopearl AF-Red-650M. They provide a convenient way to perform early resin screening for both target retention and recovery. Multiple columns can be connected in series for additional separation. Please see the ordering information at the end of this section or contact us to request more information on our ToyoScreen offerings.

FIGURE 12

COMPARATIVE DYE LEAKAGE STUDY OF AF-BLUE HC-650M AND COMPETITOR BLUE @ 25°C (AFTER 24 HOURS)



Conditions: 200 mg of each material was suspended in 4 mL of solvent and incubated at 25°C and shaking for 24 h. The absorption at 620 nm of the supernatants were measured after appropriate adjustment to neutrality with known volume of acid or base. Dye concentrations were estimated assuming a molar extinction coefficient of 12,750 (L/M cm).

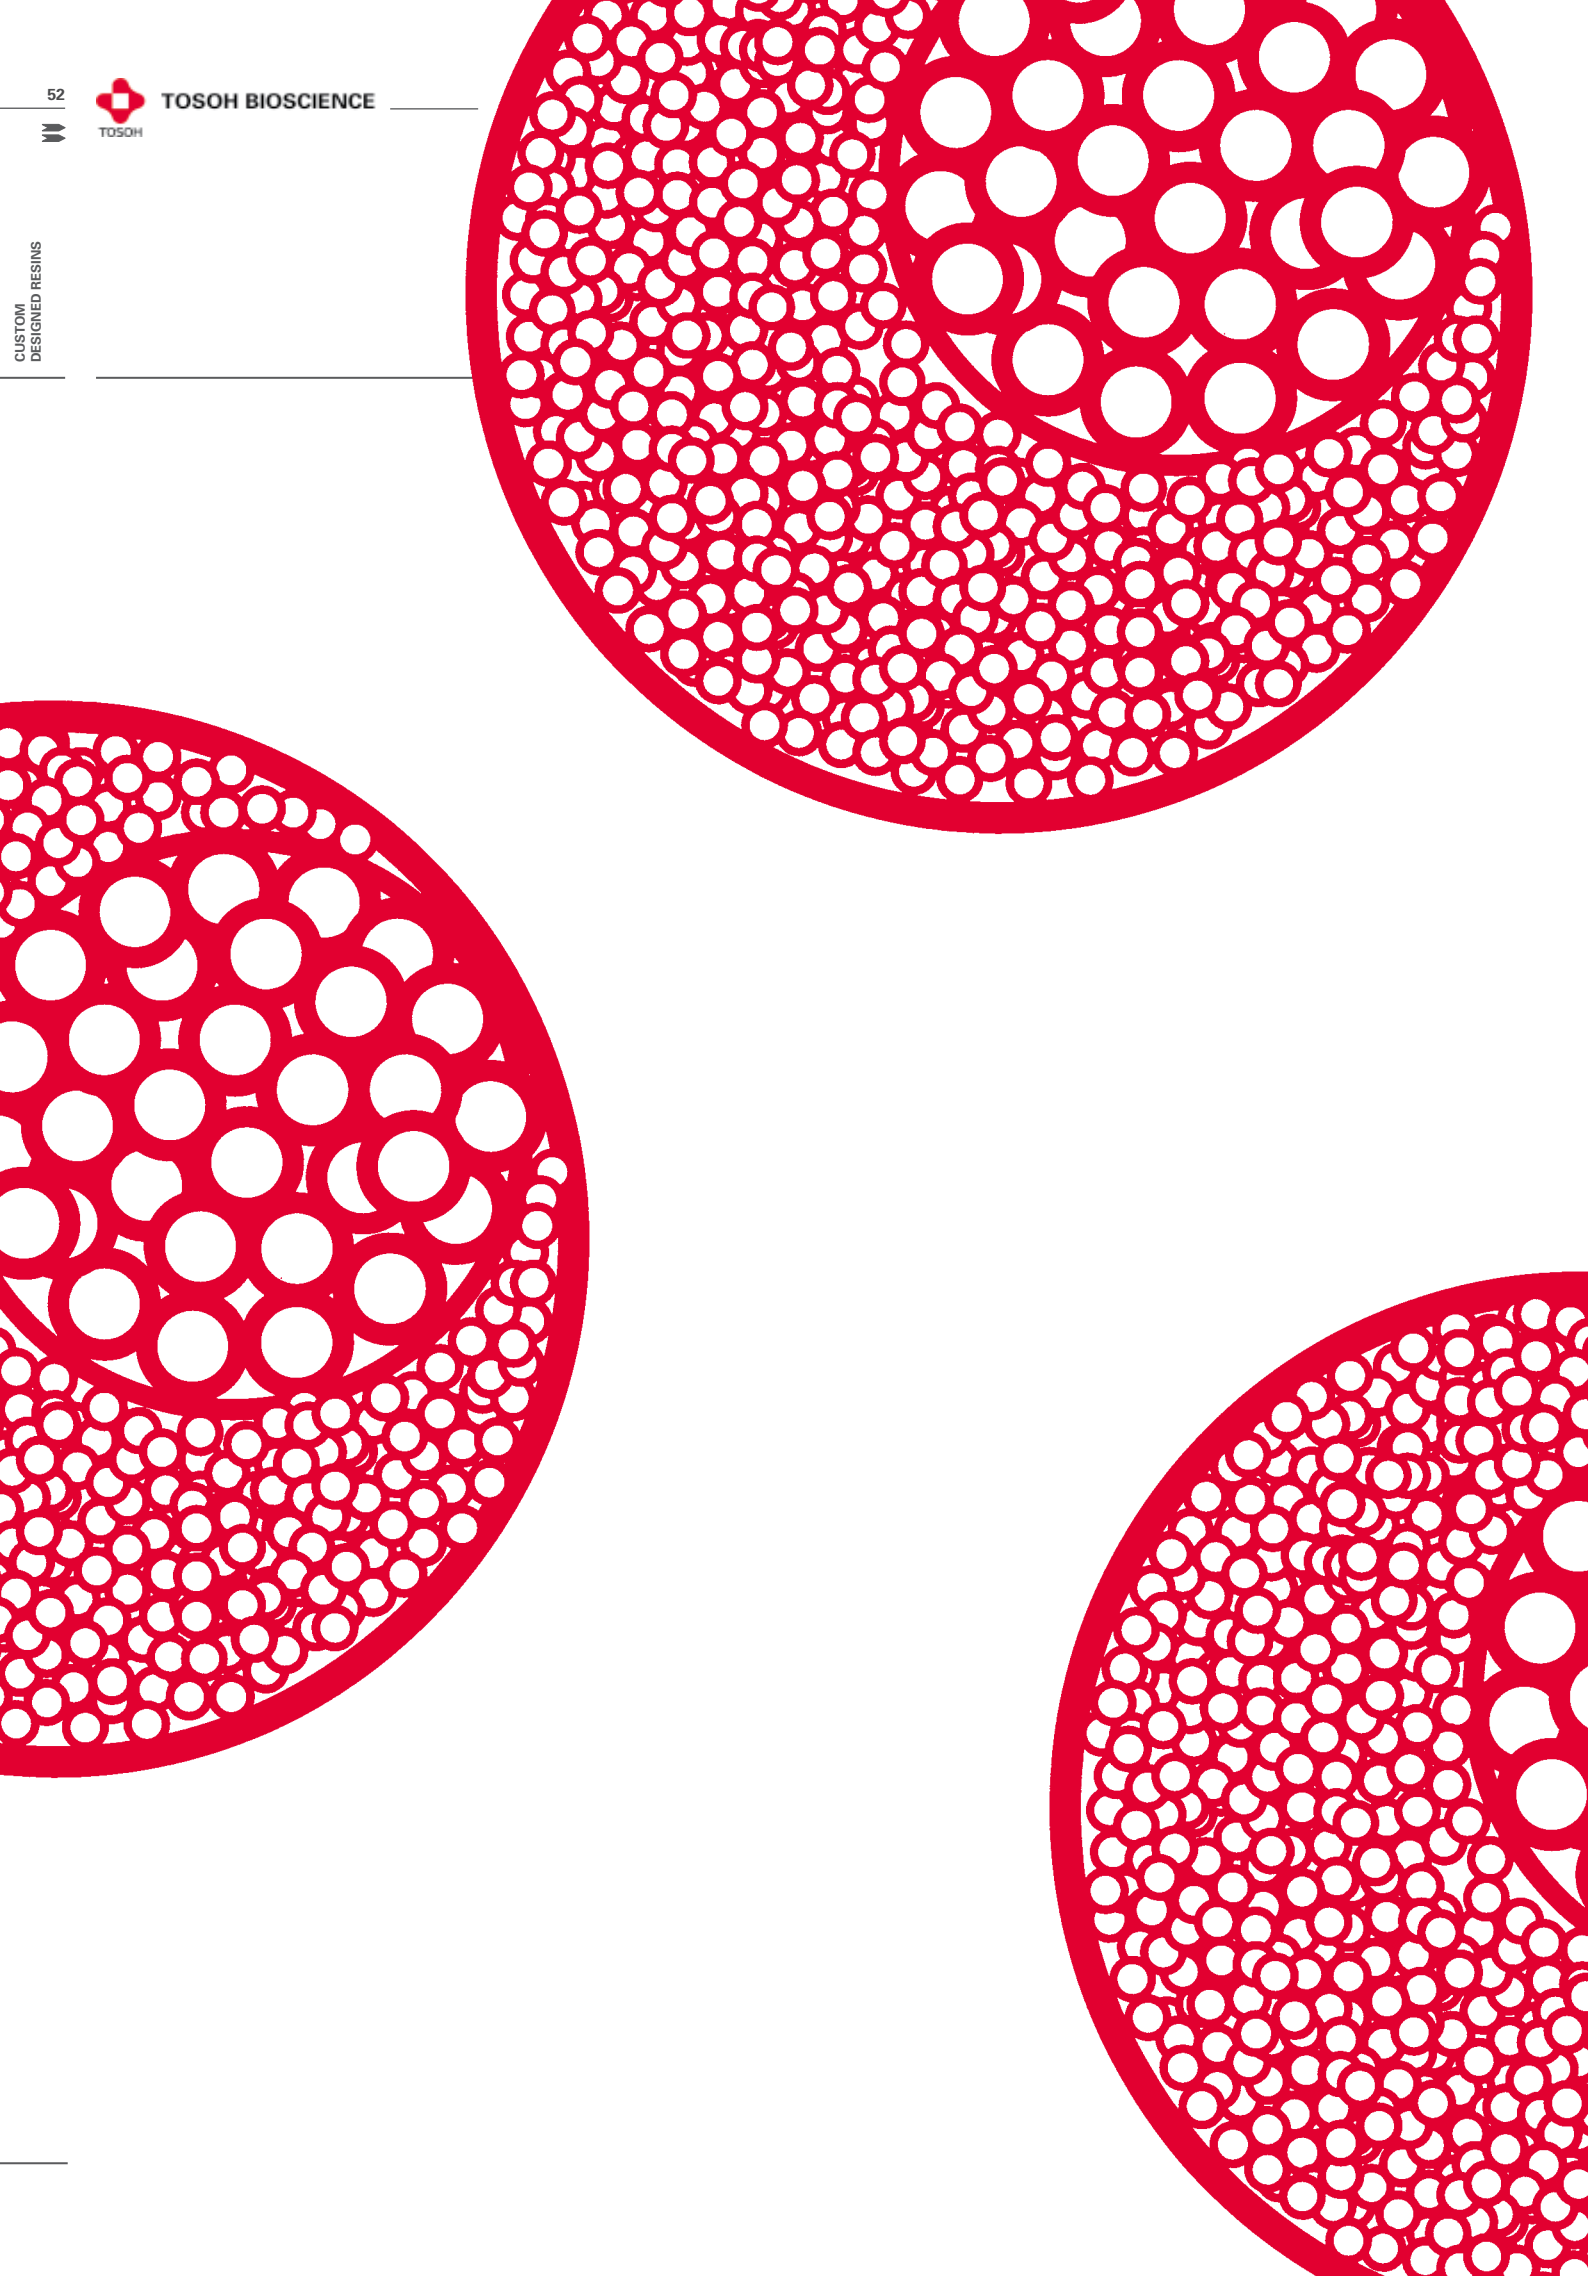
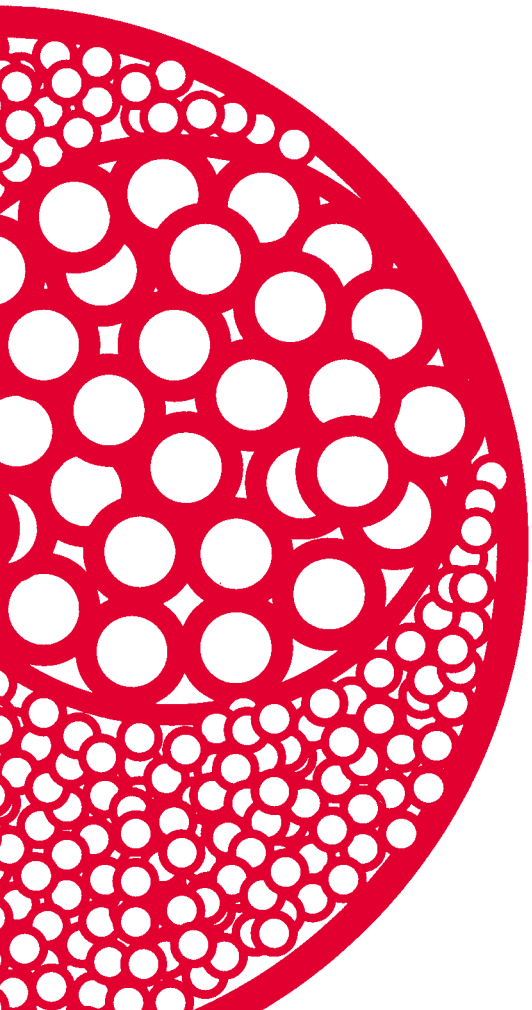
Conditions: All Toyopearl affinity resins are provided at a particle size of 65 µm. This particle size is ideal for both small and large scale separations.

*1 g yields approximately 3.5 mL of hydrated resin.



CUSTOM DESIGNED RESINS

CUSTOM DESIGNED RESINS



TOSOH FACT

Tosoh Bioscience provides solutions for today's biological purification needs. In fact, some of the first commercial HIC products were manufactured by Tosoh. We take pride in our ability to design new products based on existing chemistries to solve specific customer applications.

We encourage you to have a confidential discussion with us about your specific needs. Whether it is a surface modification of an existing product or the creation of a new one, we encourage you to call on us to meet your needs for a customized solution.

CUSTOM DESIGNED RESINS

OVERVIEW

Occasionally special purifcation needs require special adaptions to existing chromatographic resins for optimized operation of your process. This section explains in general terms Tosoh's custom resin development procedure.

TOSOH'S RESIN INNOVATION PROGRAM (TRIP)

Tosoh Corporation of Japan has introduced a new resin innovation program. Ideal candidates for this program are drug targets that have been selected for clinical trials which, if successful in the clinic, will be commercially manufactured. This program is not available for early stage laboratory research or the isolation of small amounts of new therapeutic proteins.

NEW PROJECT APPROVAL FOR TRIP

To receive a "Go" status for TRIP some evaluation is needed. During preliminary discussions, prior to the generation of scouting samples, an assessment is made of whether the project fits into Tosoh's scaffolding capabilities. If a fit is established, the projected liter volume for the new resin is reviewed. Decisions are based on the quantity projected for use after therapeutic approval and launch, but for high value added resins, projected commercial liter volumes of less than 100 liters have been approved.

NEW RESIN DEVELOPMENT TIME LINE

Tosoh Bioscience and Tosoh Corporation of Japan have the resources to develop custom resin products. The custom resin optimization timeline closely mirrors a customer's need to produce products for clinical trials. Only with detailed sample evaluation data from the customer, chemistry optimization and manufacturing lot release criteria can be established by Tosoh so a close cooperation between the customer and Tosoh is crucial.

CUSTOM DESIGNED RESINS

RESIN OPTIMIZATION (SEMI-CUSTOM COMMERCIAL RESINS)

In many cases the optimization of an already commercial resin can be accomplished by a more judicious selection of particle size, pore size, and currently available ligands (Table I). See the various combinations of these physical parameters in the Toyopearl SEC section of this catalog. When these products are combined with the comparable polymer chemistry TSKgel PW products (Table II) , there are 49 different combinations (Table III) to act as a scaffold for an improved resin product. All kinds of modes can be optimized.

CUSTOM RESINS

In more difficult situations custom resins can be developed for a customer. Ligand screening, selection, density, length of spacer arm, degree of crosslinking and degree of grafting all add to the fundamental scaffold of the semi-custom resins. The objective in designing a certain resin is to develop a bead that has maximum accessible surface area with an optimized ligand density using an appropriate spacer arm which fits the conformational attachment requirements of the target. These parameters can have a dramatic effect on the resin's chromatographic and economic performance.

GETTING STARTED

To initiate the TRIP program contact your local Business Development Manager. A period of due diligence will be started where the appropriate information can be exchanged in confidence between us. Detailed communications on these topics requires an in effect two way Confidential Information Disclosure Agreement between Tosoh Bioscience GmbH and the customer. If the project looks promising to both parties several laboratory scouting samples will be prepared and sent to the customer site for evaluation.

COMMERCIALIZATION

Once a "Go" decision is made, the performance specifications are determined from the optimized scouting samples, the custom resin enters into Tosoh's "ISO 9001" product commercialization process. Several small manufacturing batches are then made to set lot release criteria. Regulatory support studies are initiated at this time.

YOUR SPECIALIST IN SEPA RATIO

MORE PRODUCTIVE MAB PURIFICATION

- EFFICIENT MAB CAPTURING FROM HIGH TITER FEEDSTOCK
- HIGH IgG CAPACITY OVER A WIDE RANGE OF VELOCITIES
- ROBUST, ALKALI-STABLE AFFINITY RESIN
- RIGID POLYMETHACRYLATE BASE MATRIX

TOYOPEARL AF-rPROTEIN A-650F IS A HIGH CAPACITY AFFINITY RESIN DESIGNED FOR EFFICIENT PURIFICATIONS OF MONOCLONAL ANTIBODIES. LOW LIGAND LEACHING AND HIGH MECHANICAL, THERMAL AND ALKALI STABILITY IMPROVE ROBUSTNESS AND PROCESS ECONOMICS.
